

Gluing unit upgrade

MACHINE TYPE: 121 – 121A

REFERENCE CODE: AF.063

Description

The kit replaces the tipping paper gluer unit with a new version without the glue pot. The previous version features two overlapped rollers with the lower one partially dipped in the glue.

The new solution features instead the glue depositing between the two rollers by means of a nozzle, thus eliminating the need to have a glue pot. In addition, the problems of glue heating and air particles inclusion in the glue (due to the roller movement in the pot) are avoided.

With the nozzle application, the glue quantity is accurately controlled and the supply is stopped in case of machine downtime, avoiding waste and glue residuals.

The upgrade features an internal cooling system of the rollers, that permit to keep constant the glue characteristics, and an increase of the roller diameter thus reducing their speed.

The group is completely extractable for maximum accessibility in case of cleaning operations.

Advantages

- Conservation of the glue characteristics
- High dosing precision and reduction of the glue consumption
- High cleaning in gluer area
- Elimination of the glue pot
- Standardization of gluer rollers with the 121P machine

Gluing unit upgrade

Assembly time

Five (5) working days for installation by one (1) mechanical and one (1) electrical technicians.

Validity

The kit can be retrofitted to any 121-121A machine equipped with glue pot from batch no. 12007. It's standard from batch no. 13454.

How to order

Machine S/N and format dimensions are required to complete the Production Order.
