

MIND THE SAFETY

Safety by design

Safety risk analysis drives G.D technical departments during machine design going beyond the international safety standards.

On-site feedback coming from testing, installation and inspection performed by G.D technicians play, together with the customer suggestions, a key path for our designers.

Safety by education

G.D knows that the most important feature for the operator's safety is the operator himself.

Safety education is available for end users by means of updated technical documentation focusing on safety warnings and suggestions.

Step by step guides, simple descriptions and clear images effectively minimize the risks in daily activities.

A case study

Machinery relocation is the most typical case where it is possible to assess both technical features and safety level of the equipments.

An experienced team audits the machine in order to provide all necessary equipments for a safe and reliable relocation, providing guidance compliant with regional regulations, technical and logistical know-how and safety upgrades.
